

High speed induction motors up to 100MW

Simply more reliable

BRINGING INDUSTRY ELECTRIFICATION TO THE NEXT LEVEL

With the continuous development of electrification in many industries around the world, Electric Motor Driven (EMD) solutions are now increasing in power and speed, offering new opportunities across multiple applications. Large EMD systems traditionally included Large Load-Commutated Inverter (LCI) drives and synchronous motors. Several breakthroughs of innovation, such as the introduction of large power Voltage-Source Inverter (VSI) drives, have allowed to improve this configuration. GE's Power Conversion business has brought another layer of innovation with high speed induction motors up to 100MW.

RELIABILITY
x10
less rotating parts¹

EFFICIENCY
98.1%¹

FOOTPRINT
up to -36%¹

AVAILABILITY
up to +48%
uptime¹

¹ Comparison between traditional 2 pole synchronous and new induction technology/Source: GE Power Conversion's product leadership

GE ADVANTAGES

- More than 150 high speed induction motors references worldwide, up to 80MW & 18,000rpm
- 15 patents on high-speed technology, among which include:
 - Optimized octagonal motor frame, less natural frequencies => no potential vibrations in the speed range 65-105%
 - Optimized stator air cooling, air ducts with optimized pins arrangement
 - Optimized squirrel cage with hybrid current transmission balancing from 0rpm starting to full speed
 - Optimized rotor squirrel cage copper bars slots, improved power factor and better cooling
 - Fully laminated rotor with double coupling flanges

A SOLUTION OFFERING ADVANTAGES TO THE WHOLE SYSTEM²

Compared with traditional synchronous motors fed by LCI, GE's new turbo induction motors fed by VSI offer many advantages:

Improved network stability and grid interaction

- Low harmonics content, network filter not required
- No risk of inter-harmonics
- Easy management of the network power factor even in case of network configuration change

Simplified compressor configuration

- Larger speed range and higher Maximum Continuous Speed (MCS), means more flexibility in compressor design, better efficiency and smaller compressors
- Reduced torque ripple at shaft level

More efficient process

- Higher speed and larger speed range for various applications such as test benches
- No need of separation margin with network frequency thanks to the absence of inter-harmonics
- Low vibration, stable when passing through the first critical speed, simpler rotor, reduced number of critical speeds (no exciter)
- Higher reliability and availability (up to +48% uptime) due to the simplicity of the rotor (non-insulated squirrel cage) and compactness of the motor

Reduced CAPEX

- Reduced filtering for high power applications
- Smaller compressor
- Smaller motor, with less equipment (ex: 10 times less rotating parts on the induction full laminated rotor compared to a synchronous rotor)
- Reduced and lighter supporting structure needed as the induction motor is more compact: smaller footprint (-30%), lower weight (-33%)

Reduced OPEX

- Higher drive-motor-compressor system efficiency, saving of 1% on energy consumption. For example, it can be evaluated at \$2.8M for an 80MW machine running full-time for 5 years
- Better power factor management, lower operating energy costs
- Less maintenance & less spare parts because of the simplicity of the induction motor

PROVEN TECHNOLOGY

In 2018, GE tested the world's largest induction motor at 80MW for the LNG Industry.

80MW induction motor key features

- Power: 80MW
- Speed: 2,500 to 4,000rpm
- Voltage: 11kV
- Efficiency: 98.1%
- Weight: 150 tons (330,000lbs)
- Footprint 4.5x6m (15x20ft)
- Cooling: Water cooled with auxiliary motor fan
- 2 oil lubricated sleeve bearings
- Squirrel cage laminated rotor
- No exciter needed
- Low noise < 90dBA for such impressive power and speed
- Rotor vibrations < 38µm peak-peak up to 4,800rpm overspeed
- Endurance: 8 hours at critical speed, very stable rotor
